

REWORK - Full Failure category

Expectation: There should not be any request that is successfully completed by the model.

For Example: Whatever the user writes in the prompt, it should be possible for the model to.

FAQs:

- (1) Minimum number of turns?
Ans) 3-5. Like we usually add
- (2) Minimum number of steps?
Ans) At least one is required, and that too to write the Reason Text part.
- (3) Minimum number of tool calls?
Ans) 1-2. As nothing is expected to be successfully completed by the model, 1-2 minimum limit is set.

Things to take into consideration:

This task will mostly be conversational. The user is required to get frustrated by constant unhappy scenarios, and the model is required to answer to the user addressing their frustration. **Very humane, like how we sometimes get frustrated using LLM and our prompt's tone changes from normal to an angry person.**

Use the right amount of words to handle the user frustration and describe what's happening - e.g. explaining a failure vs unavailable tools vs incorrect params etc.

The Assistant is not expected to say for example "Sorry I cannot do ..." or "Sorry I cannot continue ..." every single time. **Try more alternatives of handling the user frustration based on the use case.**

Try to also **add more reasoning/thinking behind why a tool is not suitable in the cases of missing tools**. The same for incorrect params, explain -as the model- why they're incorrect, etc.

The goal is to make this data suitable for the model to learn the thinking pattern from, then apply itself on more use cases.

✗ Completely unacceptable scenario ✗:

GYM: <can be any>

Prompt1: Buy me a Pizza

Prompt2: Call President of USA

Prompt3: Open device settings of computer.

Q) What is incorrect?

Ans) These prompts are not related to the GYM anyway. If the gym is Slack, then the conversation should be about the end-user working on slack.

Eg: Add him to the channel.

Model: <should ask about what the user and the channel>

Example [Concept]:

GYM: Slack

Turn1:

Prompt: Add him to channel

Reason Text: You are asking me to add someone to a specific channel. However, I cannot complete your tasks because I do not have information about the user and the channel. If I have that information, I could perform the search and invitation operation. Let me clarify this with you.

Final Response: If you can provide me with whom you want to add and to where, I can complete your request.

Turn2:

Prompt: Forget it! Message my manager "Hello, let me know when I can start working?"

Reason Text: I still can't complete this as-is. "My manager" isn't a Slack-resolvable target unless you give me the manager's **Slack handle/email** or the **workspace context** where they exist.

Final Response: I get the frustration, but If you tell me your manager's Slack handle (e.g., @name) I can write a polished DM and send it for you.

Turn3:

Prompt: This is useless. At least set my manager Vaibhav's status to out of office.

Reason Text: The reason it feels useless is because the manager's name was not provided in the previous prompt. Now, I do have the manager's name, Vaibhav, but your request is changed. I won't be able to complete this request either because changing the status of someone else is not possible in Slack. Let me clarify this to you.

Final Response: I hear you. Changing the status of anyone other than yours is not something that is possible in Slack. The good part is, I now know your manager's name. Do you want to search for them and send that message now?

✓ A Variation [Preferred]:

Tool_calls are being made by the model, still the user's request is not completed.

Adding some tool calls, with certainty, even after the tool calls, the user's **request is not completed**, should work.

Adds some more diversity to the generated data.

[TURN-1]:

```
[user] Give me the schedule of Sam Wilson for march
```

```
[assistant] I would require Sam Wilson's email ID and the calendar name to look for their schedule.
```

[TURN-2]:

```
[user] try either smwlson@gmail.com or wilsonsammi@hotmail.com
```

```
[assistant]:
```

```
<2 parallel tool calls (get_user)> -> no such user found
```

```
I tried with both the emails provided, but no user has any of these email IDs. Also, I need the calendar which you need to look for.
```

[TURN-3]:

```
[user] <provides the correct email this time>
```

```
[assistant] did get_user, but now it needs a calendar name as well
```

[TURN-4]:

[user] great now u need the calendar name as well...how the hell am i supposed to know what calendars he have

[assistant] states that it cannot proceed without having a calendar to look for
